day job: designing digital communications technology

j@ninetiles.com

Congestion and air quality

- Mass transit for densely populated areas and corridors
 - electric traction; steel wheels on rail (rubber → particulates)
 - heavy rail for longer distances
 - light rail for shorter journeys and feeder services
- Individual transport for sparsely populated areas
- Need good connection between the two
 - transport hubs
 - less car parking but still need stabling for shared vehicles
 - integration of services from different transport providers

Improved public transport

- Better use of digital media
 - status information, especially during disruption
 - create a “community” of transport users
- As convenient as owning a car
 - contactless payment
 - how to accommodate all the things we keep in the car / van?
- Inclusivity
 - not just step-free access; mitigate effects of crowds etc
